Things to consider for testable code

Frank Kleine, 12.09.2009

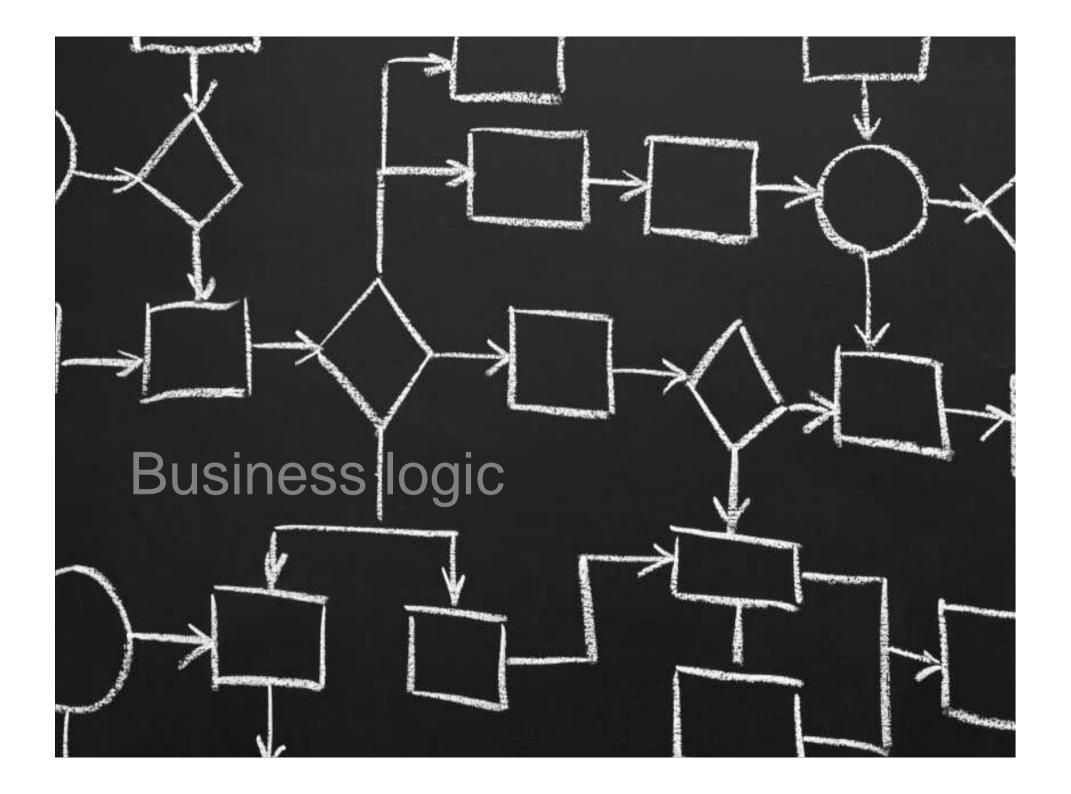

The Speaker: Frank Kleine

- 1&1 Internet AG (Head of Web Infrastructure)
- PHP since 2000
- Lead Developer
 - Stubbles
 - XJConf for PHP
 - vfsStream
- Technical editor "PHP Design Patterns"

Separation of Concerns

Typical concerns in applications

```

```

Didn't we forget something really important?

Construction of objects

- new is a very powerful keyword
- Binds usage to a concrete implementation
- Golden rule of new:
 - OK for domain classes, but not for services
 - OK in tests and specialised construction classes, but not in business logic

Construction of objects II

• Bad:

Hard to test

Work in constructor (Anti-Pattern)

class Car { public function __construct() { \$this->engine = new Engine(); \$this->tire = TireFactory::createTire();

Piece of cake to test

• Good:

```
class Car {
    public function __construct(Engine $eng, Tire $tire) {
        $this->engine = $eng;
        $this->tire = $tire;
```

Dependency Injection

Dependency Injection

- Pile of new (startup phase)
 - Create objects and stack them together
 - Boilerplate", but automatable with DI framework
- Pile of objects (runtime phase)
 - Business logic, error handling, etc.
- Factories or DI instances for runtime object creation

Law of Demeter

• Bad:

Driver

____UU

```
class Driver { Engine

public function an e($miles) {

$this->vehicle->engine- Internal state

$this->vehicle->drive( of Car

$this->vehicle->engine- revealed
```

• Good:

Piece of cake to test

```
class Driver {
    public function drive(****) {
        $this->vehicle->start();
        $this->vehicle->drive($miles);
        $this->vehicle Less prone
        to errors
```

Hard to test: test always needs Engine or a mock of it

Driver not coupled to Engine: simpler to maintain

Global state

- Same operation with same inputs should yield same results.
- Not necessarily true with global state.
- Hidden global state
 - Singleton
 - static methods
 - \$_GET, \$_POST, \$_SESSION, \$_...
 - Registry

Global state: Singletons

- Never implement any
- Required most likely due to bad design of your framework

- Use a DI framework with support for Singleton scope
 - Gives full power of Singletons
 - Code using the Singleton stays simple

Singleton with

Configure the binding

independent of

PhpSession

```
$binder->bind('Session')
    ->to('PhpSession')
    ->in(stubBindingScopes::$SINGLETON);
```

Enforce
singletoness: DI
framework will only
create one instance
of PhpSession and
inject always this
same instance

```
Tell DI framework
class Processor
                        to inject required
                                                  Dependency
    protected $se
                          parameters on
     /**
                                                   Injection
                           creation of
      * @Inject_
                            Processor
      */
    public function __construct(Session $session) {
         $this->session = $session;
                                    Piece of cake to
                                         test:
```

Global state: static methods

- Not always bad
 - Simple operations without dependencies
- Always bad if state is involved
 - Might return different results with same input.

Global state: \$_GET, \$_POST, ...

- Ugly to test
- Rule: never access those vars directly in business logic
- Abstract access to globals with classes
 - Remember: Singleton is evil
- Even better: interfaces
- Security: use a Request class which enforces filtering/validating input

Global state: Registry

- Using a DI framework: no registry required
- Without DI framework: use Registry for config values only
- Did I already mentioned that Singletons are evil?
 - static methods are enough

Finally...

 If you remember only one little thing of this presentation it should be...

The End

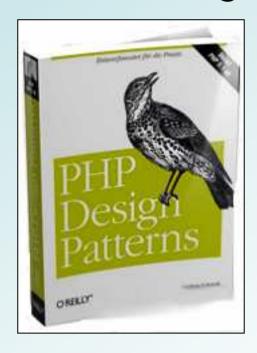

Questions and comments?
